METHODS

DEMO 0

**Plain
JS
projects**

**VUE
JS
projects**

What are the drawbacks of coding FRONT END using only PLAIN JS ?

VUE 2.0

VUE 3.0

3 DIFFERENCES

CREATE APP

```
const app = new Vue({  
  el: '#app',  
  data: {  
    title : "My list of teachers",  
  }  
})
```

```
const app = Vue.createApp({  
  data() {  
    return {  
      title : "My list of teachers",  
    };  
  },  
});  
  
app.mount("#app");
```

VUE 2.0

VUE 3.0

3 DIFFERENCES

```
const app = new Vue({  
  el: '#app',  
  data: {  
    title : "My list of teachers",  
  }  
})
```

MOUNT TO DOM

```
const app = Vue.createApp({  
  data() {  
    return {  
      title : "My list of teachers",  
    };  
  },  
});
```

app.mount("#app");

VUE 2.0

VUE 3.0

3 DIFFERENCES

PROVIDE THE DATA

```
const app = new Vue({  
  el: '#app',  
  data: {  
    title : "My list of teachers",  
  }  
})
```

```
const app = Vue.createApp({  
  data() {  
    return {  
      title : "My list of teachers",  
    };  
  },  
});  
  
app.mount("#app");
```

DEMO 1

{{ }} MUSTACHE

SCRIPT

Provide
Data

```
const app = Vue.createApp({  
  data() {  
    return {  
      objective: "learn Vue 3",  
    };  
  },  
});  
app.mount("#app");
```

Mount
DOM element
to VUE app

TEMPLATE

```
<div id="app">  
  <p>{{ objective }}</p>  
</div>
```

DOM element
to mount

Mustache

DEMO 2

V-BIND:XX (or just :XX)

SCRIPT

```
const app = Vue.createApp({
  data() {
    return {
      vueLink: "https://v3.vuejs.org/",
    };
  },
});
app.mount("#app");
```

TEMPLATE

```
<div id="app">
  <p>Learn more <a :href="vueLink">Vue</a>.</p>
</div>
```

We bind HREF property
To the data vueLink

<p>Learn more <a href= "https://v3.vuejs.org/" Vue </p>,

DEMO 3

V-FOR DIRECTIVE

```
<p v-for="item of items" :key="item.id"> {{item.name}}</p>
```

Iteration
variable

Unique
key

<p>BANANA</p>

<p>MANGO</p>

<p>APPLE</p>

DEMO 4

CALL METHODS

SCRIPT

```
methods: {  
  getObjective() {  
    if (this.batch === "batch2021")  
      return "learn vue js";  
    else {  
      return "I don't know";  
    }  
  },  
},
```

TEMPLATE

```
<div id="app">  
  <p>{{ getObjective() }}</p></div>
```

Call the **method**
Whenever something change on the VUE

DEMO 5

V:ON (or @) - DOM EVENT

SCRIPT

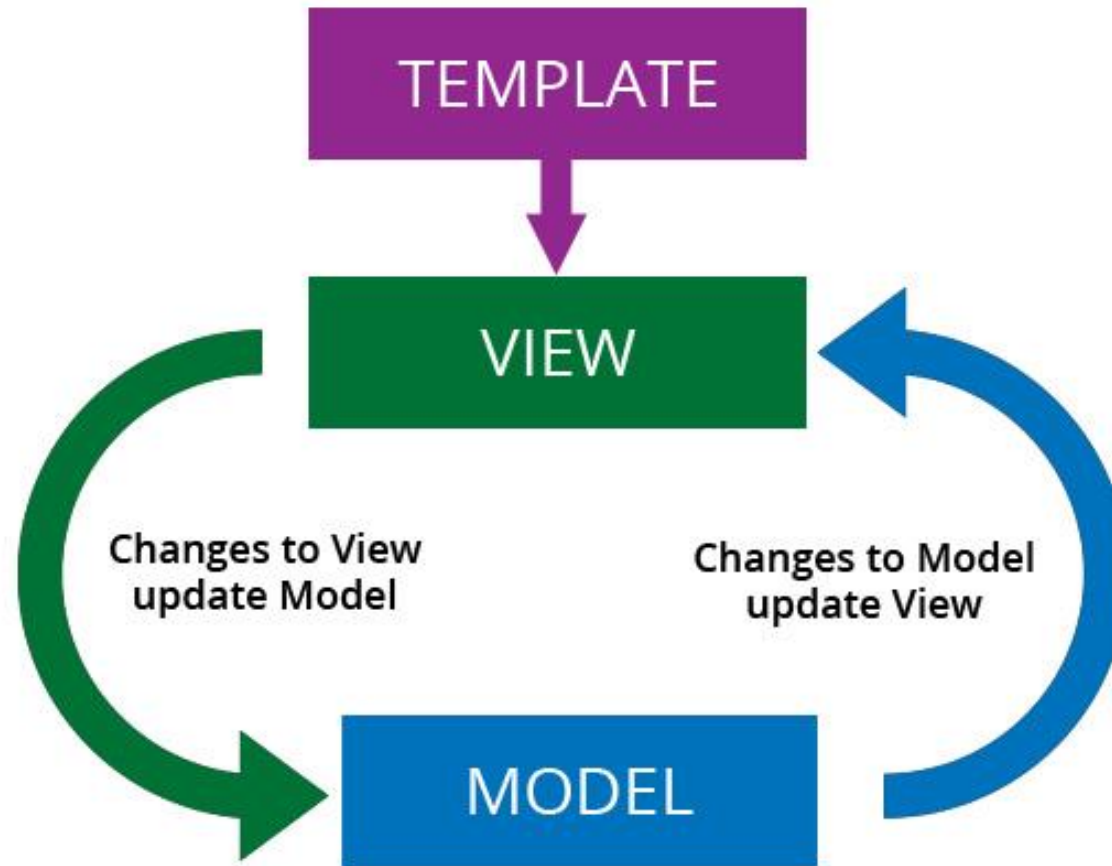

```
methods: {  
  add() {  
    this.counter = this.counter + 1;  
  },  
},
```

TEMPLATE

```
<div id="app">  
  <button @click="add">Add</button>
```

Call the **method**
When the DOM event "click" is raised

What is a 2 way binding?

DEMO 6

2 way binding manually

SCRIPT

```
data() {  
  return {  
    name: "";  
  };  
},  
methods: {  
  setName(event) {  
    this.name = event.target.value;  
  },  
},
```

This is just JS event properties !

TEMPLATE

```
<input type="text" @input="setName($event)" />  
  
<p>{{ name }}</p>
```

Call the **method**
When text is entered

DEMO 7

2 way binding with **v-model**

SCRIPT

```
data() {  
  return {  
    name: "";  
  };  
},
```

TEMPLATE

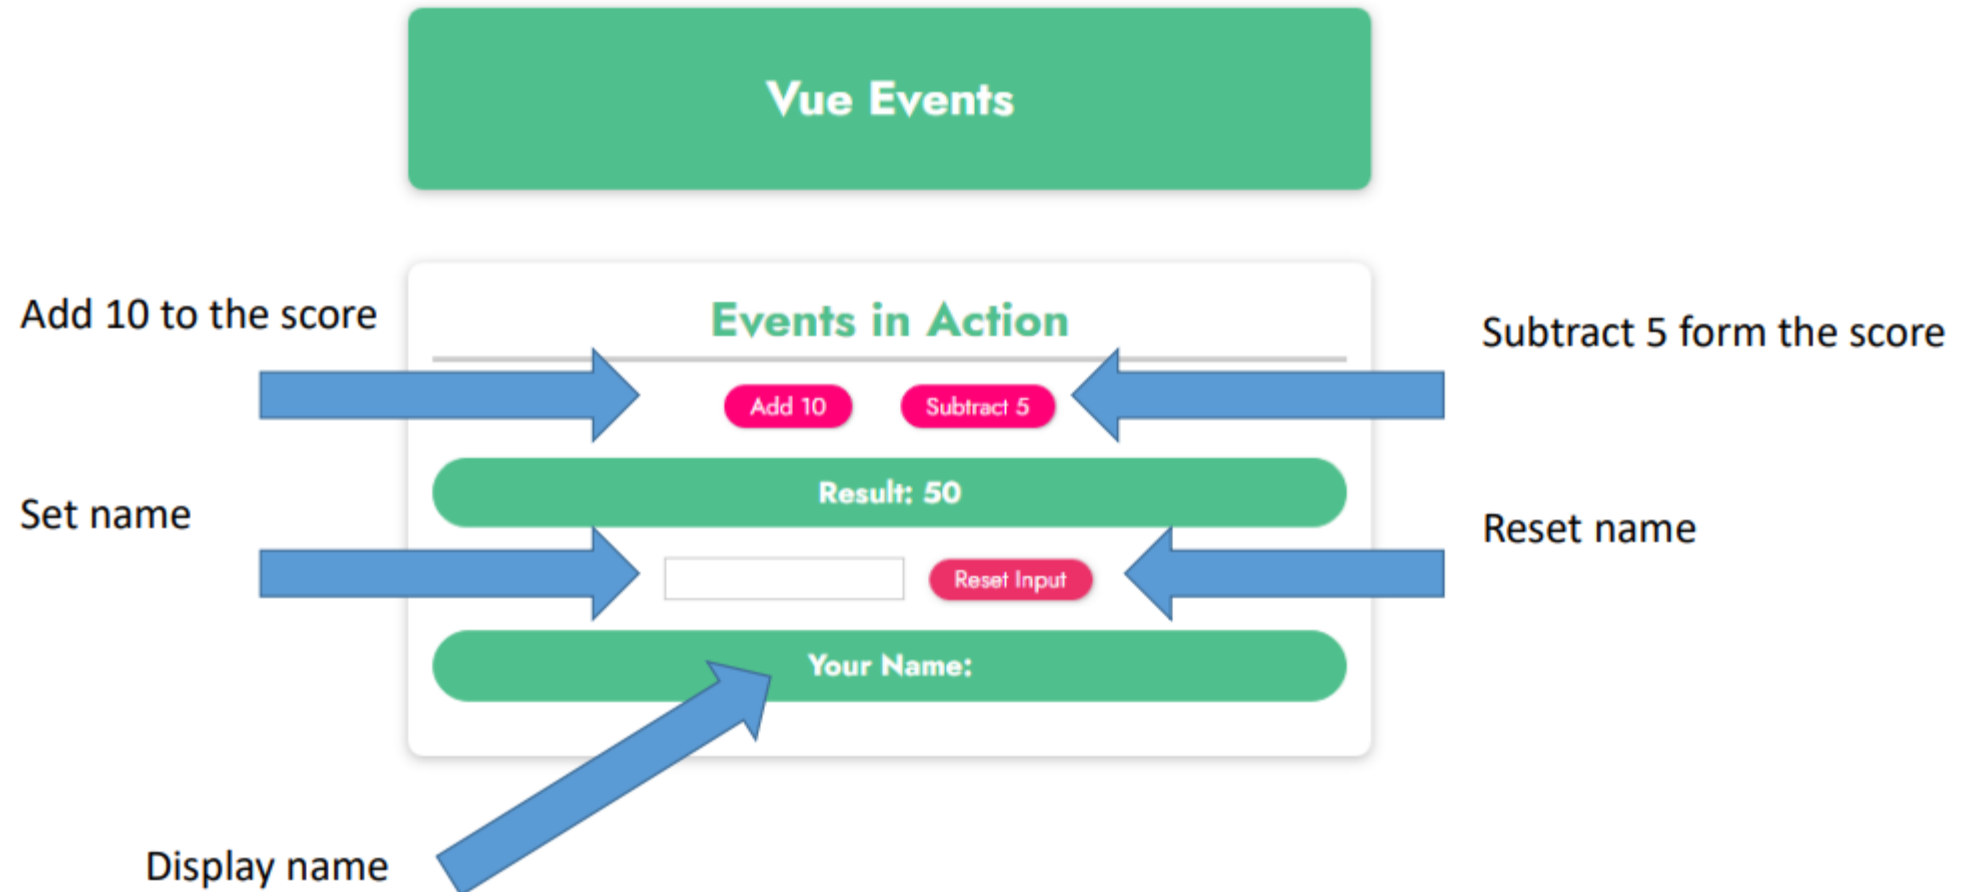

```
<input type="text" v-model="name" />  
  
<p>{{ name }}</p>
```

2 way binding

ACTIVITY 8

YOUR TURN !!!

DEMO 9

Computed VS methods !

THE FIGHT

COMPUTED

```
computed: {  
  fullname() {  
    console.log("Running again...");  
  
    return this.name + " " + " teacher";  
  },  
},
```

*How many time
This is called ?*

METHOD

```
methods: {  
  getFullName() {  
    console.log("Running again...");  
  
    return this.name + " " + " teacher";  
  },  
},
```

*How many time
This is called ?*

DEMO 10

Watch

SCRIPT

```
watch: {  
  counter(value) {  
    console.log("new value", value);  
  },  
},
```

✓ A watch is just a **LISTENER** on a VALUE

~~✓ NO data~~

✓ A good way to FETCH to the API

Shorthands !

`v-on:click`  `@click`

`v-bind:href`  `:href`

Method >> Computed >> Watch

Methods

Use with event binding OR
data binding

Data binding: Method is
executed for every “re-
render” cycle of the
component

Use for events or data that
really needs to be re-
evaluated all the time

Method >> Computed >> Watch

Methods

Use with event binding OR data binding

Data binding: Method is executed for every “re-render” cycle of the component

Use for events or data that really needs to be re-evaluated all the time

Computed

Use with data binding

Computed properties are only re-evaluated if one of their “used values” changed

Use for data that depends on other data

Method >> Computed >> Watch

Methods

Use with event binding OR data binding

Data binding: Method is executed for every “re-render” cycle of the component

Use for events or data that really needs to be re-evaluated all the time

Computed

Use with data binding

Computed properties are only re-evaluated if one of their “used values” changed

Use for data that depends on other data

Watch

Not used directly in template

Allows you to run any code in reaction to some changed data (e.g. send Http request etc.)

Use for any non-data update you want to make

ACTIVITY 11

YOUR TURN !!!

Vue Dynamic Styling

A is RED if Selected

Do the same of B and C

DEMO 12

Fetch back end API
